

How to keep safe online

Jiří Kalvoda

Today people use network very often. We should stay home because coronavirus. Online activities is often the only possibility to do something or spend our time. But online world is danger. Computer is save only if it is shut down and lock in the safe. If you communicate with somebody, you should validate him identity and have on mind that owner of server could read your conversations.

If you are using computer, you should know what you do and remember for possible threats. Ideal antivirus don't exists and responsible user is often much more. If you browsing untasted web pages, you shouldn't insert passwords or other personal information. If you write password, page certificate have to correspond with institution name. Valid certificate isn't satisfactory.

Downloading files is mostly out of danger, but running it as application is very danger. Application have almost the same authority as user. You should install app for only from official repositories for your system. If it not possible you can build it from source code after quick check.
